[ABSTRACT]

An in-plane switching (IPS) mode LCD device is disclosed, which improves
5 aperture ratio and picture quality, by partially overlapping a common electrode formed
in parallel to a data electrode in a pixel region with gate and data lines, thereby
increasing an actual pixel region. Also, the common electrode has the slanting
structure at a crossing portion of data and common electrodes, whereby liquid crystal
molecules of the pixel region are rotated at the same direction, thereby preventing
10 disclination.
